Data Governance, (Compliance) and Ethics

Lecture 6: ETHICAL ISSUES PERTAINING TO DATA (PART 1)

Jaswinder.singh@ncirl.ie

Overview of course content

1. Data Governance and Management (Weeks 1-3)
2. Privacy and Data Protection (Weeks 4-6)
3. Ethical Issues Pertaining to Data (Weeks 7-9)*
4. Fairness, Accountability, and Transparency of Algorithmic Systems (Weeks 10-12)

Ethical Issues Pertaining to Data
Topics to cover

- Ethics and Computing – examining moral problems when using the Internet - spam, censorship and free speech, anonymity offered by the Internet.
- Ethical issues arising from the increasing use and pervasiveness of Information Technology and socio-technical systems.
- Health technology.. Pervasive monitoring and tracking.. Image, video and sound capture.. Identity.. Perpetuity of data storage.. Transnationality..

Ethics looks at ***what*** you should do and,
more philosophically, ***why*** you should do it.
Ethics is about obligations: it is the study of "should-ing".

Ethics

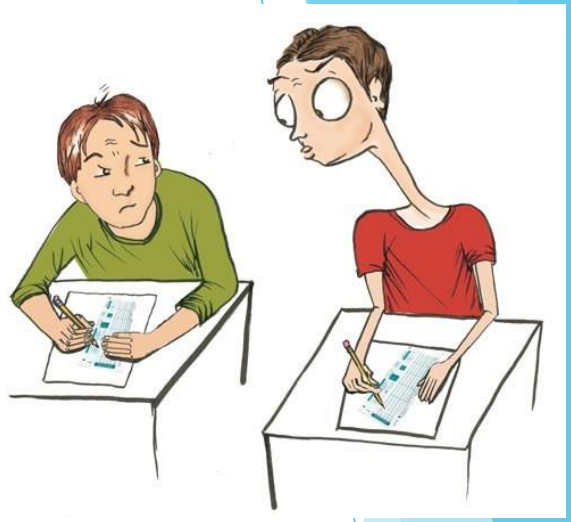

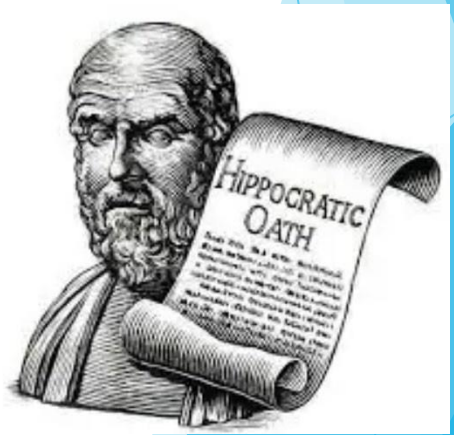

https://slidetodoc.com/unit-3-ethics-what-is-ethics-introduction-ethics/

Morality, Ethics and Law (1/2)

- **Personal Morality**
  - One's personal beliefs about right and wrong
  - Influenced by a range of personal, cultural, philosophical, religious and societal concerns
  - Moral acts are those that conform to what an individual believes is right
- **Group or Professional morality and ethical standards**
  - Codes of conduct. As a member of a group or profession, you may subscribe to or accept certain ethical standards
  - May be informed by a range of historical, cultural, philosophical, religious, societal, aesthetic concerns
  - Group conflict may bring an individual into conflict with their own personal morality

Morality, Ethics and Law(2/2)

Societal Morality

- Widely shared social conventions
- Form basis for an established societal consensus about what is right and what is wrong
- Provide boundaries of generally acceptable behaviour
- Resolution of differences between views of what is acceptable a complex process

Social norms when queuing

Law

- System of rules that tells us what we can and cannot do
- Laws are enforced by a set of institutions
- Legal acts are those that conform to the law or at least do not contravene it
- Courts exist to resolve contradictions and ambiguities

Respecting seat belt laws

What Is The Subject “Ethics?”

- **Ethics (or Moral Philosophy)** is a branch of philosophy that "involves systematizing, defending, and **recommending concepts of right and wrong behavior**.”

- Ethics is typically divided by philosophers into three main areas:

Metaethics

Study of the meaning of ethics - attempts to answer the fundamental philosophical questions about the nature of ethical theory itself, how truth values may be determined

- Is God the ultimate source of moral guidance?
- Are ethical rules subjective or objective?

Normative ethics

Study of moral duties, rules within its social context - what makes actions right or wrong, what makes situations or events good or bad, and what makes people virtuous or vicious

- How do we determine what to do and how to act? ?

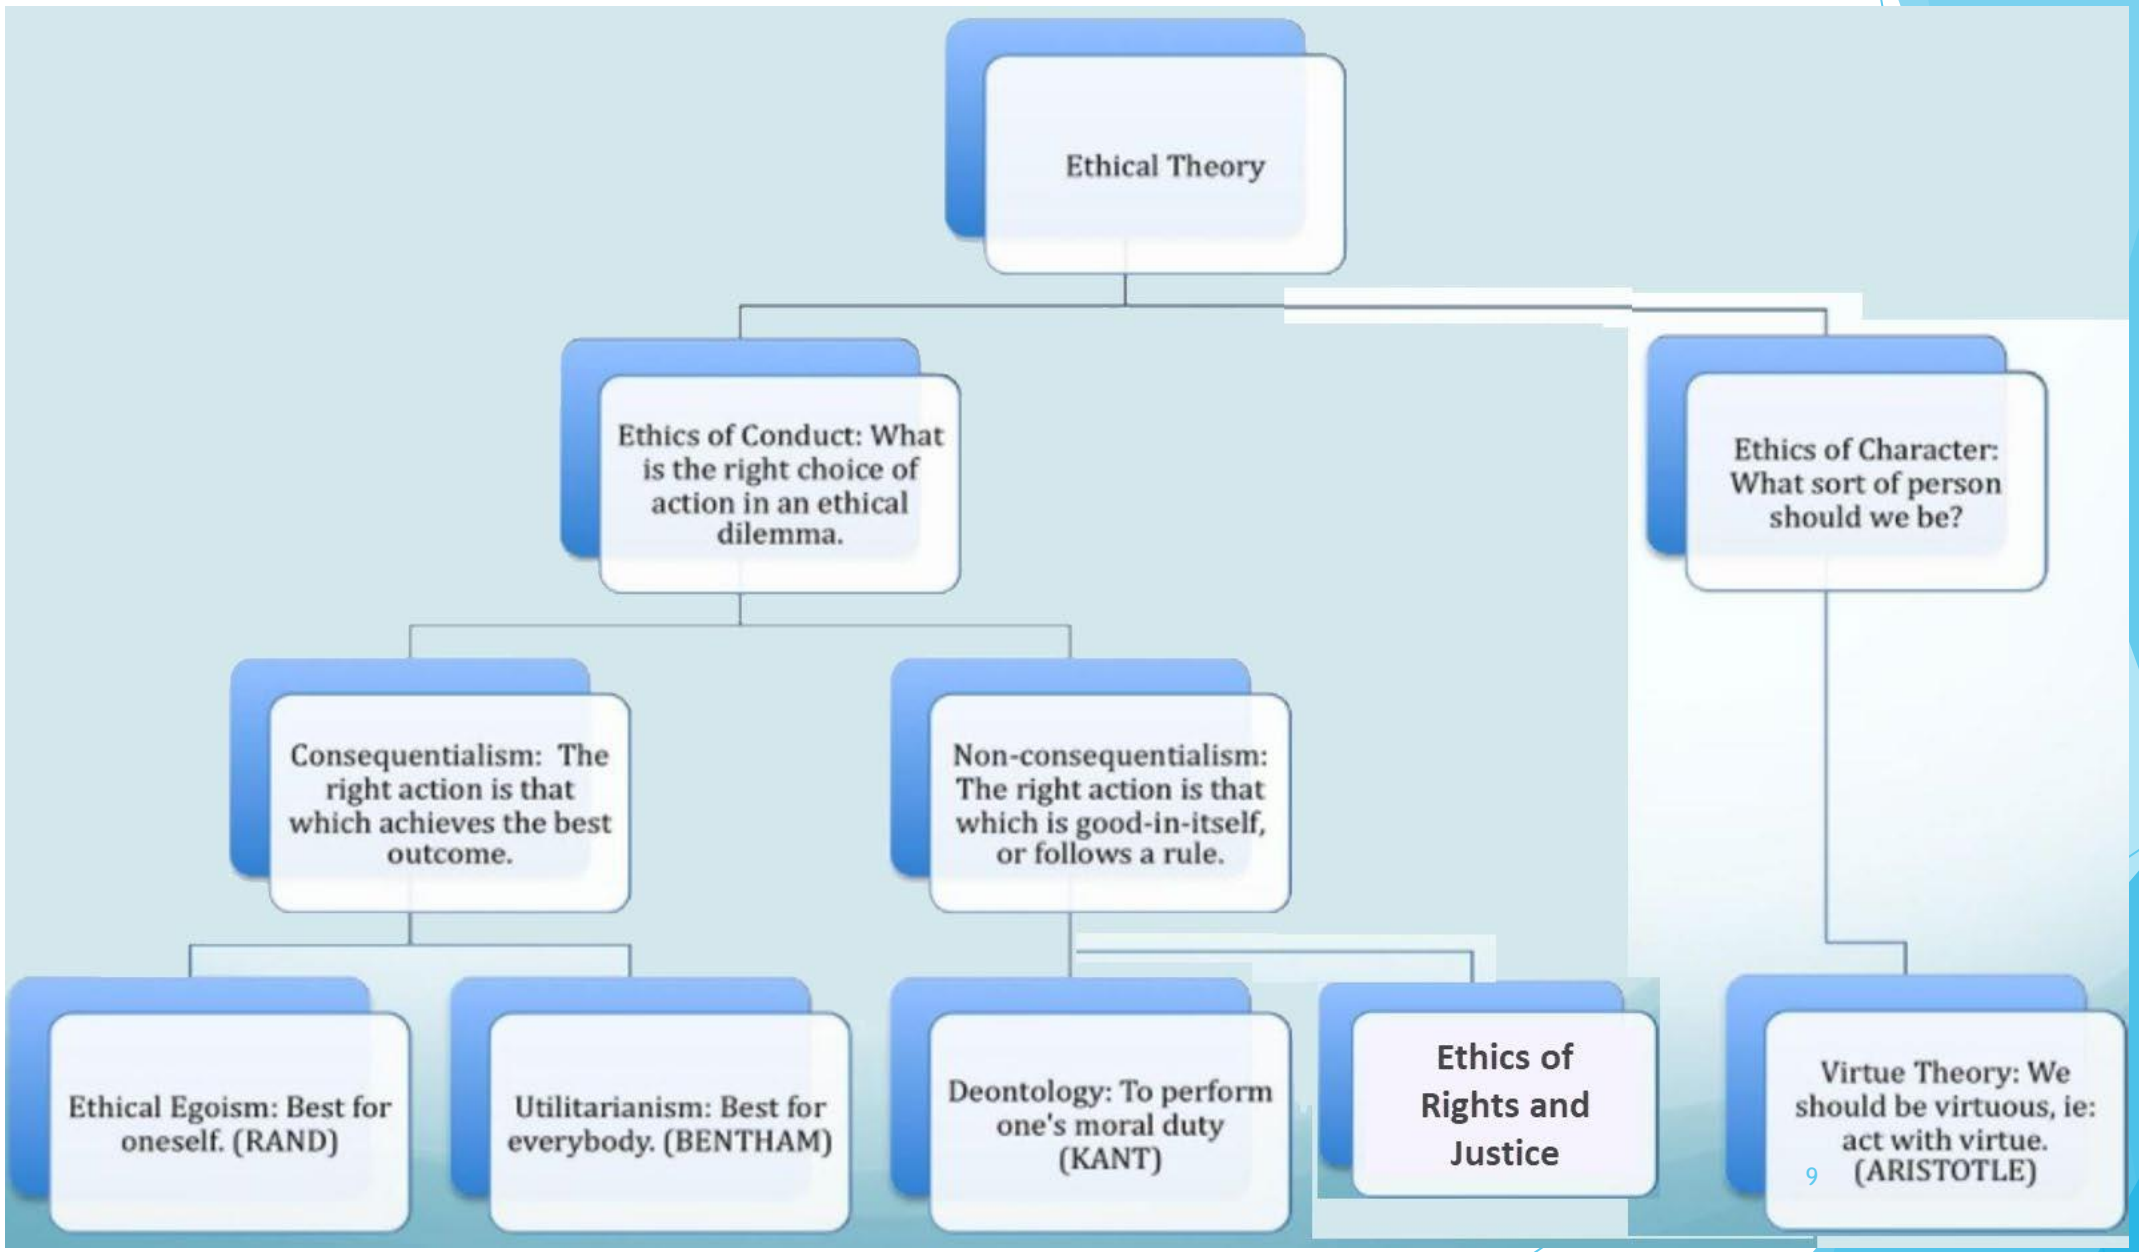

Applied/Comparative ethics

Application of ethical principles - examining specific controversial issues “Ethics in the real world”

- Is unauthorised computer file-sharing unethical?
- Do we have moral obligations to the environment?

Branches of Normative Ethics

https://slideplayer.com/slide/12451081/

Deontological Ethics (Rule-based ethics)

- It states that people should **adhere to their obligations and duties** when engaged in decision making when ethics are in play
- **Definition of "good":** Fulfillment of moral obligations, duties. A deontologist will always keep his promises to a friend and will follow the law
- One flaw is that there is no rationale or logical basis for deciding an individual's duties
- Deontological ethics **focus on the intent** behind an action (its "rightness") **rather than on its outcomes**. Provided you took the right decision, the outcome is less important (Good actions justify what ever happens)
- Examples: The Ten Commandments (Do not kill, Do not steal…)

Examples of Deontological Theories:

- Divine Command Theory
- "The Golder Rule": "Do to others as you want them to do to you"
- Natural Law and Natural Right theories
- The Non-Aggression Principle
- Kantian Ethics (categorical imperative): Act in such a way that you treat humanity.."

Consequentialist Ethics And **Utilitarianism**

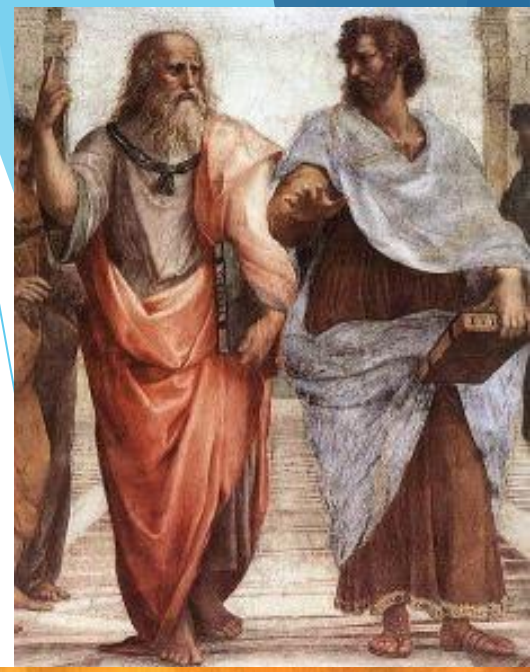

- An action is morally right **if it produces a greater quantity of good or happiness than any other possible action**. "The greatest good for the greatest number of people"
- Definition of "good": Acting to promote best outcomes
- **Don't look at the intent of an action, look at the consequences.** This provides a clear contrast with Deontological ethics
- Focus on the goals behind an action or decision, not the rules that determine it
- Ask the question "What is the greater good?" and respond to objections with "the ends justify the means"
- But consider – who is to decide what the greater good is? Is it fair to sacrifice the position of the minority so that the majority can benefit?
- Is the context or severity of an action not also relevant (e.g. is it right that some should die to save others?)
- Should data privacy be sacrificed for the "greater good of progress"

If Batman would make an exception of his "No killing rule", just this time, wouldn't that help make the world a better place?

Virtue-based ethics

- These theories judge a person by his/her character rather than by an action that may deviate from his/her normal behavior.
- The objectively right act is the one a person of a certain type ("the virtuous person") would choose.
- Definition of "good": Flourishing
- It takes the person's morals, reputation, and motivation into account when rating an unusual and irregular behavior that is considered unethical.
- Good behaviour is usually seen in terms of the "golden mean" – virtues are halfway between two vices (courage is a virtue – but is on a spectrum between cowardice and rashness)

- How to apply Virtue Theory?

  An action is morally permissable, if and only if, it is the action that a virtuous person would have taken in the circumstances.

  If a person X, displays the virtues, S1, S2, S3, S4… Sn in action A, then person X is justified in performing action A.

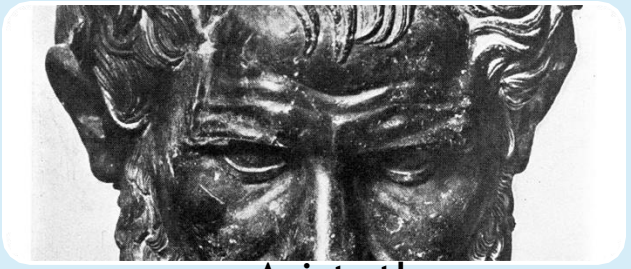

Flourishing is "when people experience positive emotions, positive psychological functioning and positive social functioning, most of the time," living "within an optimal range of human functioning."

The key virtues according to classical philosophers

Plato

Cardinal Virtues:
Wisdom,
Courage,
Temperance
Justice.

Aristotle

Courage, Temperance, Liberality, Charisma, Generosity, Ambition, Patience, Friendliness, Honesty Wit /humour, Modesty, Justice /Sense of right & wrong

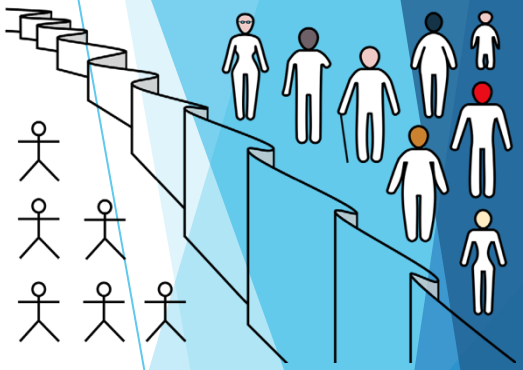

Confucius

"To be able to practice five things everywhere under heaven constitutes perfect virtue: Gravity, Generosity of soul, Sincerity, Earnestness, Kindness"

Social Justice based ethics

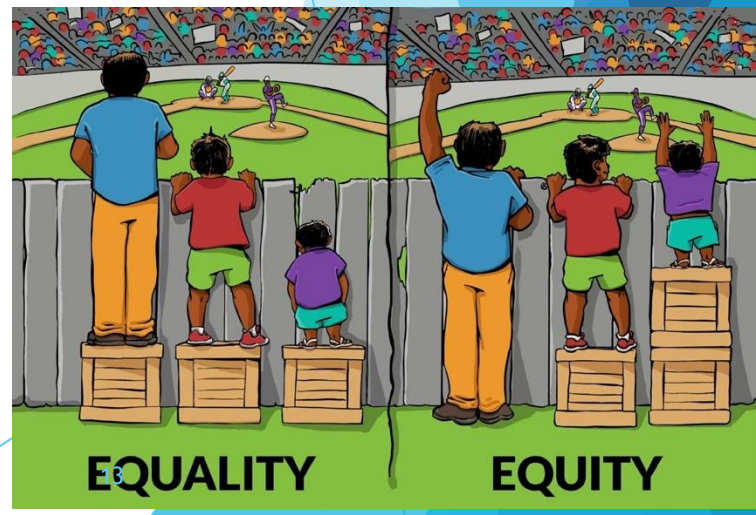

John Rawls (1921-2002) and the "veil of ignorance"

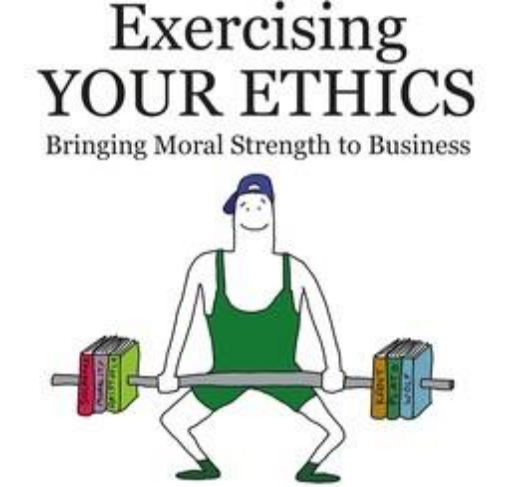

- Also focus on the **common good** but focus on the position of the weakest in society; that is **those whose interests would most likely be less represented**
- we should sacrifice some happiness overall to **assure that the distribution is just**
- John Rawls (A Theory of Justice, 1971) argued that the basic rules governing society should be designed to benefit most those least well off.
- Others (Gauthier, Morality by Agreement, 1986) have argued that, at a minimum, any social policy should not improve the condition of those already better off by making those already worst off worse off yet

- How is an action likely to affect their ability to live a good life for those least advantaged in a society?
- Societal welfare can only be judged by the welfare of its citizens who are in the weakest position.
- Do special measures have to be implemented to ensure that their interests are taken into account?

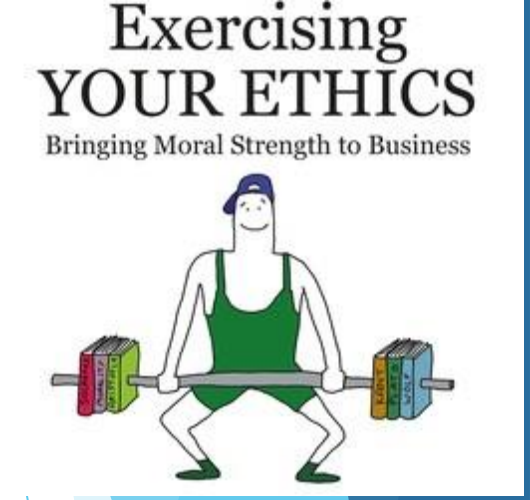

Practical Ethics

- **Theories of Ethics (summary)**
  - **Utilitarianism-based ethics**: An action is morally right if it produces a greater quantity of good or happiness than any other possible action. “The greatest good for the greatest number of people”
  - **Rights-based ethics**: Individuals have rights that should not be sacrificed simply to produce a net increase in the collective good.
  - **Relativism**: Maintain that truth is subjective, merely a matter of opinion (cultural or personal).
  - **Virtue-based ethics**: Is concerned with a person's motivation for action and not with the action itself. Instead of defining moral rules as obligatory duties, the emphasis lies on the individual to develop good habits of character based on these rules, this theory emphasizes moral education.

- **Example:** A company is behind on production due to this covid19 situation. Should management force employees to work on Saturday just to get caught up?

Practical Ethics

- **Example**: A company is behind on production due to this covid19 situation. Should management force employees to work the weekend just to get caught up?

- **Outcomes:**
  - **Utilitarianism-based ethics:** Mngt would mandate Saturday work, a greater number of customers would benefit from having the service
  - **Rights-based ethics:** Mngt would not mandate Saturday work, against the employees' rights
  - **Relativism:** Mngt would make the employees work on Saturday, the culture of the company is very centered around work and production
  - **Virtue-based ethics:** Mngt would not make the employees work on Saturday, if manager were in employees' position, he wouldn't want to work

CODE OF ETHICS TYPES

The goal of a code of ethics is to ensure that an organization's employees abide by the law and always conduct business in a forthright manner for the benefit of all stakeholders. These are three examples of how codes of ethics can be framed.

COMPLIANCE-BASED CODES

- Contain clear-cut rules, often enforced by government
- Set specific penalties for failure to comply
- Intended to promote moral responsibility

VALUE-BASED CODES

- Emphasize responsible conduct
- Focus on public good and environment
- Emphasize self-regulation over outside governance

PROFESSIONAL CODES

- Outline ethical standards of professional groups
- Emphasize fiduciary duty: act in client's interest
- Focus on duties of integrity, objectivity, truthfulness

Source: Investopedia

… and yet, ethics in the business world …

- Several trends have increased both the risks of and the potential negative impact of inappropriate or unethical behaviour in business
  - Globalization creating complex work environments
  - Increased competition mean organizations challenged to maintain profits / revenue
  - New services and products enhance capacity for negative consequences for certain groups
  - Heightened vigilance by:
    - Employees
    - Shareholders
    - Regulatory agencies

Former Cambridge Analytica chief receives seven-year directorship ban

Alexander Nix handed penalty for 'potentially unethical' behaviour linked to scandal

▲ Cambridge Analytica's former chief executive Alexander Nix has been barred from acting as a company director for seven years. Photograph: Tolga Akmen/AFP/Getty Images

Alexander Nix, the former boss of Cambridge Analytica, has been banned from serving as a company director for seven years over "potentially unethical" behaviour linked to his position at the centre of a global scandal.

What are Information Technology (IT) ethics?

- *IT ethics is the study of the **ethical issues arising out of the use and development of electronic technologies**.*
- *Its goal is to identify and formulate answers to questions about the **moral basis of individual responsibilities and actions**, as well as the **moral underpinnings of public policy**.*
- ***IT ethics raises new and unique moral problems** because IT affects not only how we do things but how we think about them, it challenges some of the basic organizing concepts of moral and political philosophy such as property, privacy, the distribution of power, basic liberties and moral responsibility."*

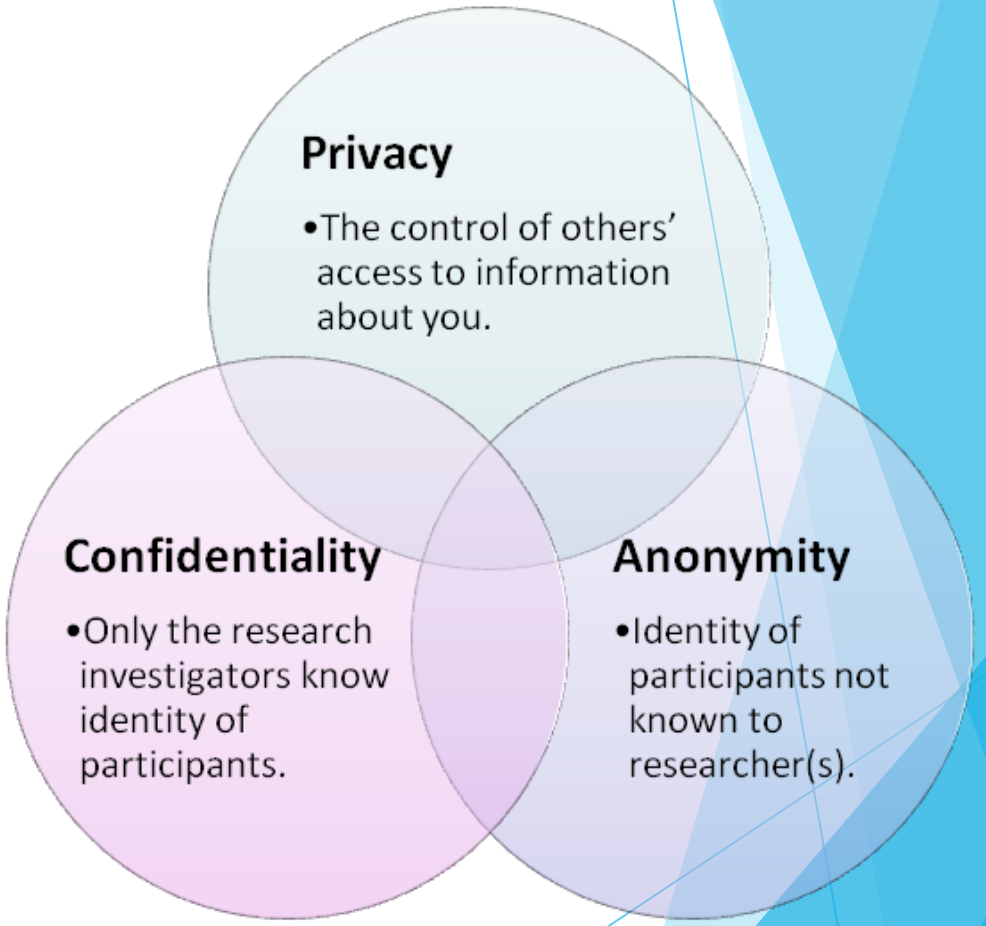

https://www.bbc.com/news/technology-54175359

Nissenbaum *Information Technology and Ethics* (1998)

Ethical Concerns and Computing

- Incorrect use of information technologies in a way to disturb privacy and property create several ethical dilemmas, which lead to ethical problems regarding technology use.
- Computers have a commonplace influence on decision-making processes assumed by most individuals
- **Computer ethics** focuses on human decision making and actions influenced or directed by use of computer technologies

Computer technology is a rapidly developing field which makes it difficult to predict what is coming next. Hence, we must constantly identify and address ethical issues that arise

Some Issues Arising In Ethical Use Of Computing

- Spam
- Censorship and free speech
- Anonymity
- Cyberbullying
- Copyright
- Other: Image generation models, etc.

Spam

- is unwanted or unsolicited email (Junk email)
- include malicious links, malicious code, or malicious attachments
- Basic problems with spam
  - Spam is against privacy policies
  - It can be illegal
  - Spam is malicious
  - Users can easily lose legitimate messages

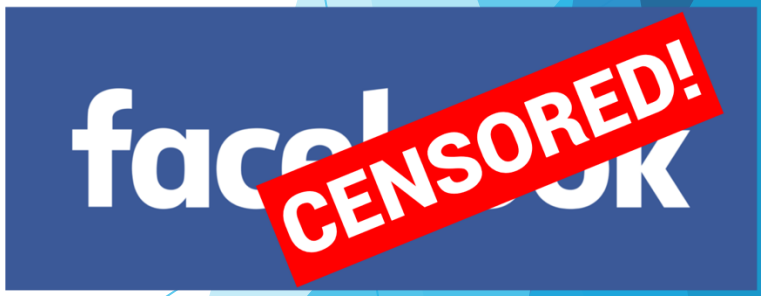

Censorship and free speech

- Freedom of speech gives people the right to express themselves, but it not gives them right to compel others to listen them. It doesn't give me the right to spread child pornography or deliver "hate speech". Nor does a right to free speech allow me to tell lies about you or to shout "fire" in a crowded cinema (limits on free speech under the terms of the First Amendment of the United States Constitution)
- Censorship is defined as curbing free speech. It normally has derogatory connotations but society favours controls on some of the abuses of free speech mentioned above.

- Is it desirable or possible to achieve this balance on the internet?
- Can the internet be a community of interest agreeing to the same ethical standards?
- Does it have mechanisms to achieve the correct balance between free speech and the desire to prevent abuse?

Anonymity on Internet

- Technology makes it easier to be anonymous making transparency even more important as an issue for communications and actions
- Anonymous communications on the Internet open the door to many forms of anti-social, immoral and even criminal behavior reducing the risk of repercussions.
- Trolling, cyberbullying, revenge-porn are examples where the use of IT has tilted the balance in favour of immoral behaviour and reducing the power and resilience of the victims of this type of behaviour.

Cyberbullying

- Cyberbullying is a form of bullying or harassment using electronic means.
- Increasingly common (based on media reports) and has led to serious consequences for victims including self-harm and even taking of own life.

Copyright: Law and Ethics (1/2)

- Copyright is a law that gives you ownership rights over the things you create (but usually not in perpetuity).
- Owner rights include:
  - the right to reproduce the work
  - to distribute copies
  - to perform the work
  - to display the work publicly

Copyright: Law and Ethics (2/2)

- Plagiarism occurs when you use someone else's work in a way that suggests the work is your own.
- Plagiarism is also an ethical issue
- Legal definition taken from Cornell Law School's Legal Information Institute:

"Deliberately passing off somebody else's original expression or creative ideas as one's own. Plagiarism can be a violation of law if copyrighted expression is taken. Often, however, plagiarism does not violate any law, but instead simply marks the plagiarist as an unethical person in the political, academic or scientific community where the plagiarism occurs."

https://people.howstuffworks.com/ethics-and-crime-plagiarism.htm

Avoid Plagiarism, acknowledge your sources

When Should I Acknowledge My Sources?

You should acknowledge your sources whenever you use a source of information:

- as your inspiration
- as the source of a theory, argument or point of view
- for specific information such as statistics, examples or case studies
- for direct quotation (using the author's exact words)
- to paraphrase or summarise an author's work

https://canberra.libguides.com/c.php?g=599301&p=4148700

Academic Honesty | **What is Plagiarism?** | What is Collusion?

Academic Integrity | How do I avoid plagiarism?

Plagiarism is the act of taking another person's words, ideas, data or images and using them as your own without giving credit to the original source of the information.

Examples of plagiarism

The following are a few examples of plagiarism:

- Copying words or ideas from someone else without giving them credit
- Copying illustrations, graphs or computer code (for code, check permitted use with your lecturers)
- Paraphrasing another's work too closely, with only minor changes, but with the essential meaning, format and/or progression of ideas maintained
- Failing to put a quotation in quotation marks – this is considered plagiarism even if you reference the source because you have presented the working as a paraphrase
- Relying on a specific idea or interpretation which is not one's own, and which has not been properly cited
- Piecing together the work of others from multiple sources, and representing them as original work
- Presenting as independent work done in collaboration with others (i.e. collusion)
- Preparing an original and correctly referenced assignment and submitting part or all of the assignment twice for separate subjects/courses

See Page 11 of the **NCI Library Referencing Guide, 5th edition** for more examples of where and how plagiarism occurs.

https://libguides.ncirl.ie/referencingandavoidingplagiarism

Acknowledging Sources

What is meant by 'acknowledging sources'?

Acknowledging sources means providing written recognition of any ideas that are used or adapted for students' work.

- You need to provide the name of the original author and details of where you found the information.
- You may need to acknowledge sources within the body of a work.
- You should acknowledge sources at the end of your work.
- 'Referencing', 'citing' and 'attribution' are terms often used to refer to the acknowledgement of sources.

https://slideplayer.com/slide/7388245/

So, it's "just grabbing the data" (?) - Paper Review

- Authors showed that **most researchers adopt a "personal ethics"** approach to decision-making about the use of social media (SM) sites as a source of data for research

"For one computer scientist mining data for aggregation and data modelling, data was generally thought of as **usable without the need for any form of permission**: 'the idea of just grabbing the data, maybe six months, maybe potentially years after it was written, **I don't think that requires ethical approval or necessarily the consent of the people involved'**" (researcher 9)

Samuel, G., Derrick, G. E. and van Leeuwen, T. (2019) 'The Ethics Ecosystem: Personal Ethics, Network Governance and Regulating Actors Governing the Use of Social Media Research Data', *Minerva*. Springer Netherlands, 57(3), pp. 317–343. doi: 10.1007/s11024-019-09368-3.

Ethics in Research

- Create a Data Management Plan (DMP)
- Create Data
- Make your Data FAIR

- Store & Secure your Data
- Create Metadata
- Gain Informed Consent

- Share your Research Data
- Preserve your Research Data
- Licence your Data

https://libguides.ucd.ie/data/intro

Ethical Principles: Before The Research Process

Consider Code of Ethics and Ethical Principles

- What are the **ethical strengths and limits of the methods**?
- Have the **data been used ethically** in a similar context before?
- **Are the methods respectful of your respondents'** capacity and willingness to participate? Some methods will work better with some groups than with others.
- Are there any **potential unintended consequences of your research**, e.g. disclosures of sensitive information, that may arise through those methods, potentially causing stress or embarrassment?
- Do the methods proposed fit with ethics principles? If not, can the exception be justified? Is what you are proposing to do justifiable in terms of the benefits, risks and harms of your research?

Research Ethics

- "**Research** is a formal, systematic application of the scientific approach to the study of a problem to discover new information or expand and verify existing knowledge"
- Different ethical emphasis Between the protection of the subject of the research and the general advancement of knowledge

Why Be Concerned About Ethics In Research?

- If the objective of research is to “discover new information or expand and verify existing knowledge” it is important when conducting research involving people that this **knowledge does not come at the expense of their welfare or rights.**

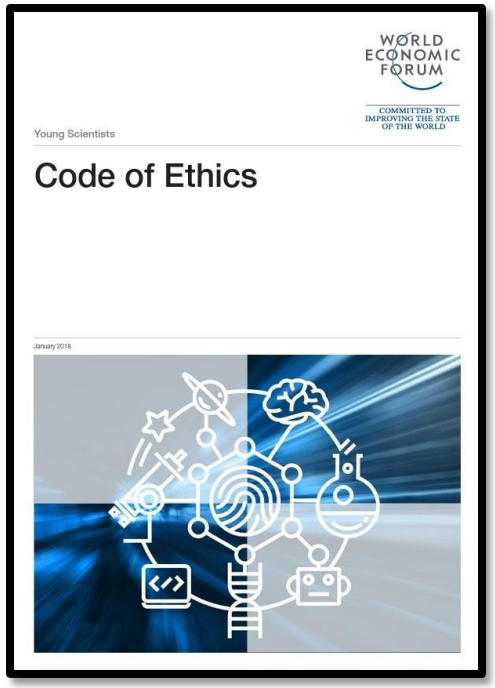

- **Research ethics provide a guideline or set of principles that support researchers in conducting research so that it is done justly and without harming anyone in the process.**

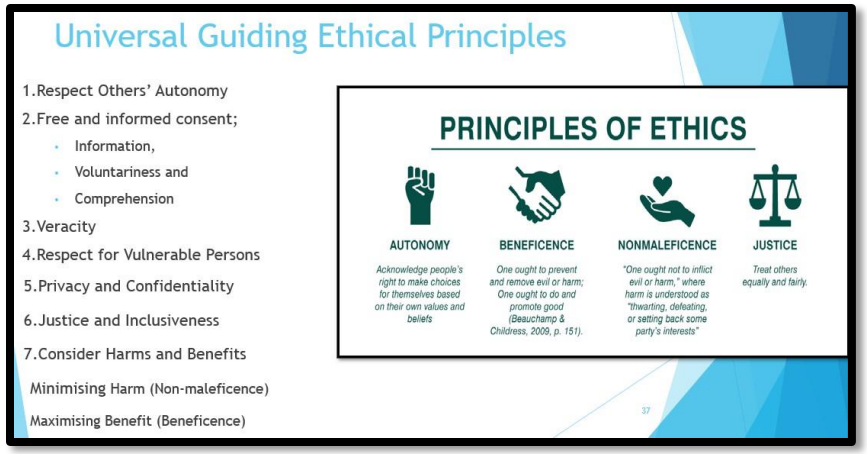

- It is the duty of the researcher to ensure they are carrying out their research project in line with established ethical standards.

- Every step of the research project, from formulating your research question to publication, needs to be informed by ethics to ensure integrity of the project.

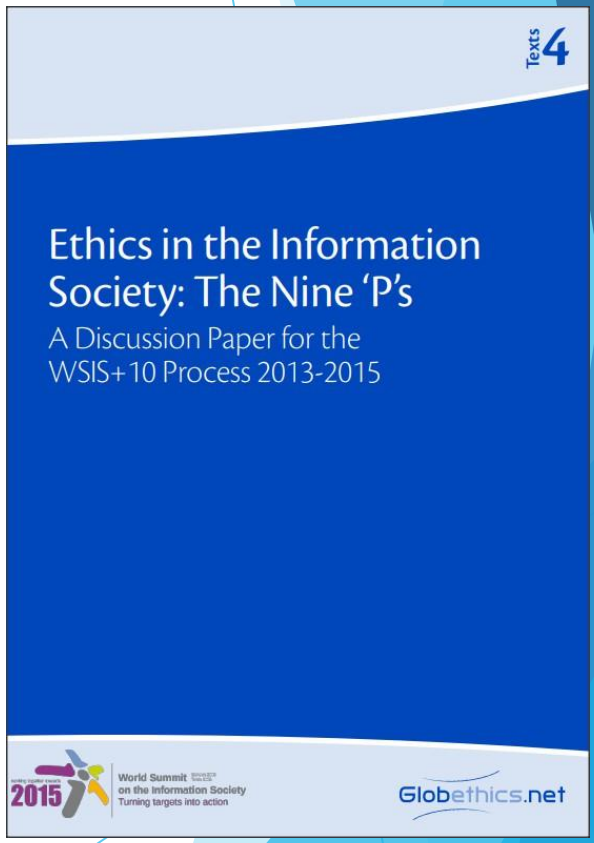

Code of Ethics and Ethical Principles

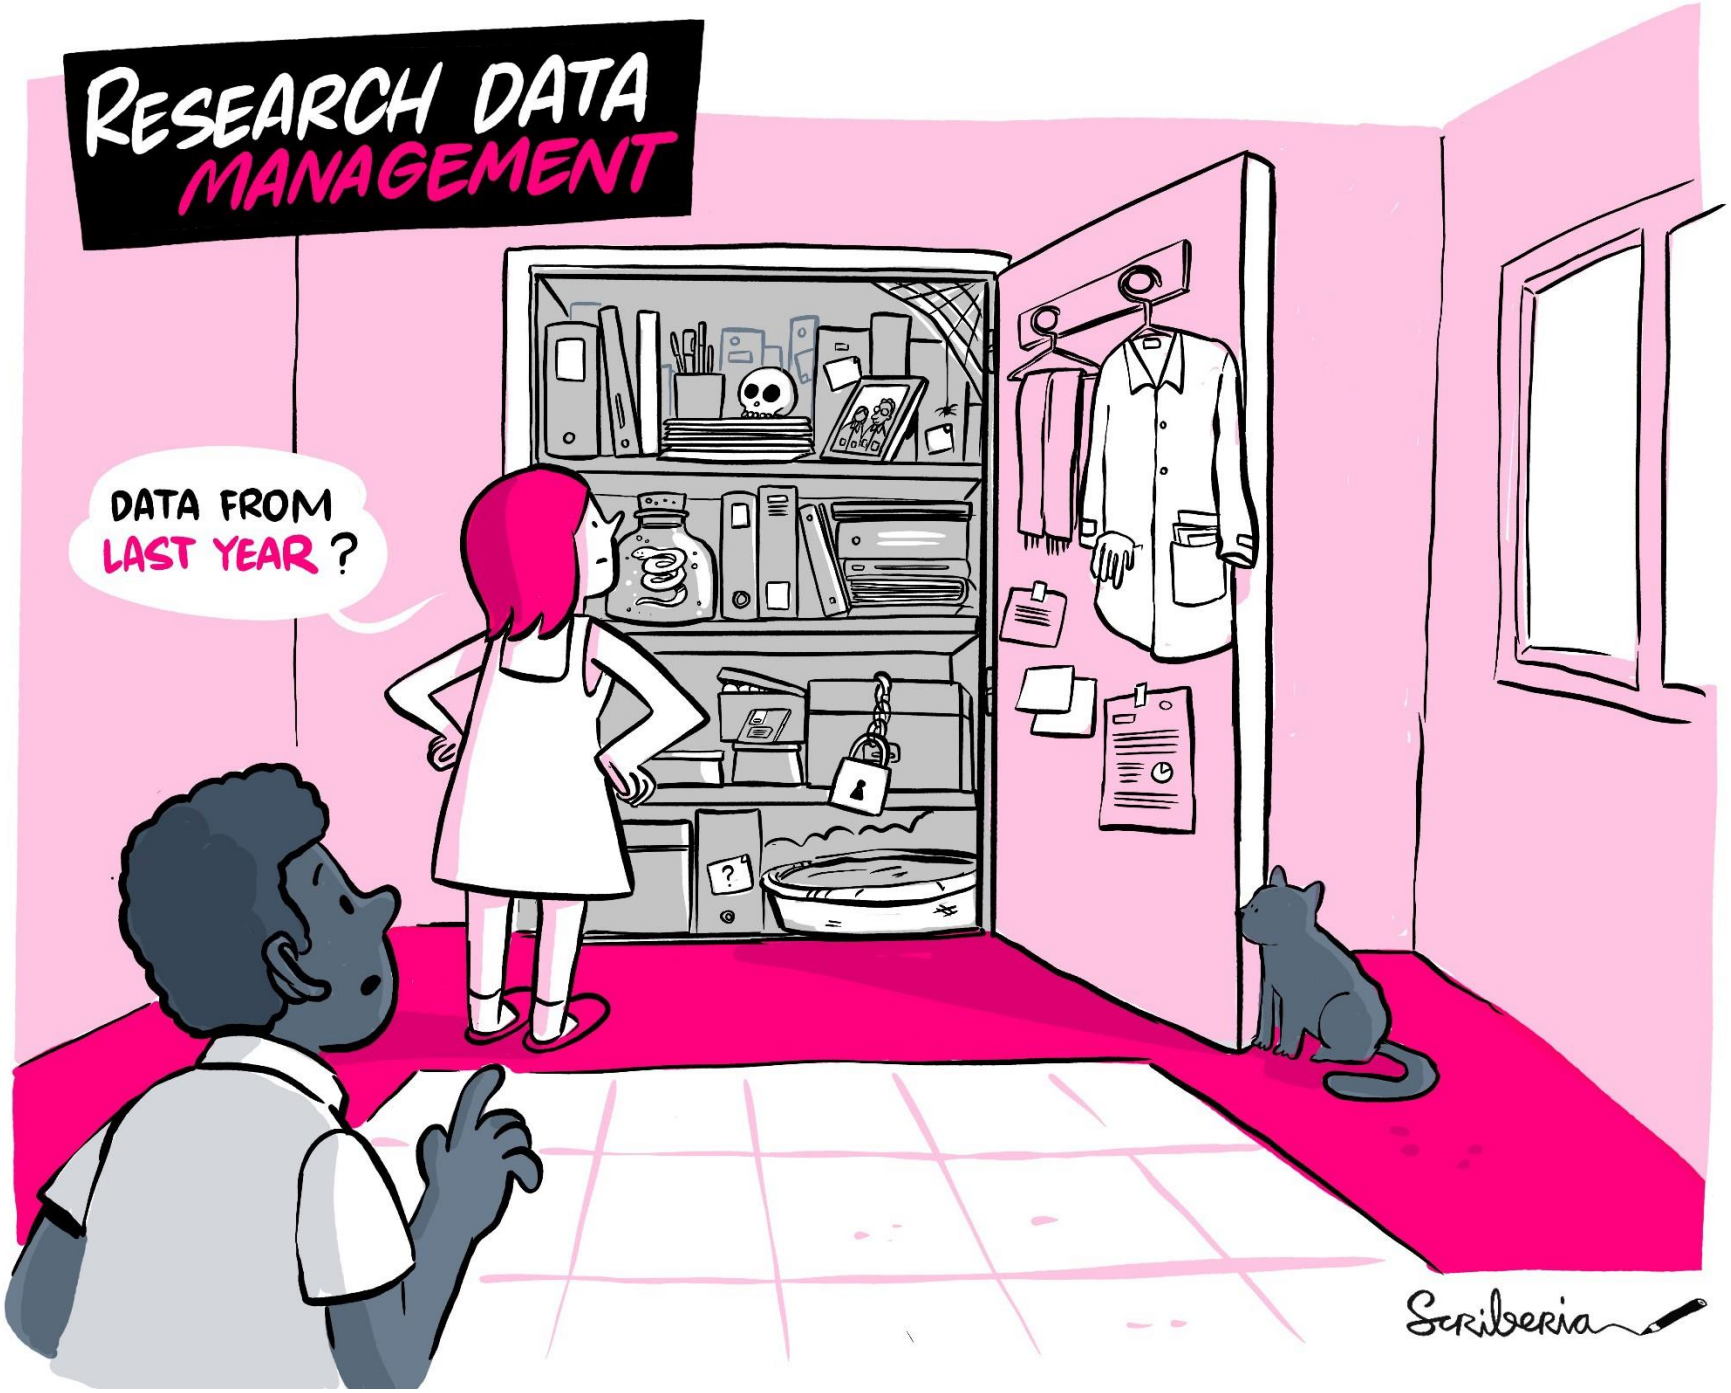

Sampling

- Selecting samples or **groups of people to study** is one of the first tasks in designing your study, and the first ethics question you face in sampling is **who you include, or exclude.**
  - You should be clear about why the people you want to study need to be involved.
  - You should also reflect on who is left out of your study, and why.
- **Your sample will often determine which ethics committee you need to go to**, and who you need to seek permission from, so it is critically important to think through the ethical implications of the sampling strategy you develop.
- If your sample includes particular groups in the population, such as children and young people, or vulnerable adults (a person aged 18 years or over who may require assistance to care for themselves, or protect themselves from harm or from being exploited)
- You will have additional requirements and considerations to address; for example getting **consent** from guardians, as well as the participants.

The Turing Way project illustration by Scriberia. Used under a CC-BY 4.0 licence. DOI: 10.5281/zenodo.3332807.

Managing Your Data

- **Dealing with data is a key element of research ethics**, regardless of whether you are collecting new data, or if you are using existing data for secondary analysis or review
- Data management is also increasingly highlighted by funders and research ethics committees as an explicit priority for researchers
- In part this reflects the legal requirements of the Data Protection Act, but this concern is fundamentally rooted in key ethics principles, about the **anonymity and confidentiality that participants are promised** when they give their informed consent

2021 Majorana – Retraction

Quantum computing's reproducibility crisis: Majorana fermions

Sergey Frolov

The controversy over Majorana particles is eroding confidence in the field. More accountability and openness are needed – from authors, reviewers and journal editors.

most developed approach, researchers mus
first grow a nanowire crystal – a feat in itself –
to produce a column of atoms 100 nanometre
(one-thousandth the width of a human hair
across. Then they must connect the wire to
circuit sensitive enough to measure single elec
trons travelling through it. The whole exper
iment must be done at about one-hundredth
of a degree above absolute zero, in a magneti
field 10,000 times that of Earth's.

Two physicists in the field say extra data Kouwenhoven's group provided them after they questioned the 2018 results shows the team had originally excluded data points that undermined its news-making claims. "I don't know for sure what was in their heads," says Sergey Frolov, a professor at the University of Pittsburgh, "but they skipped some data that contradicts directly what was in the paper. From the fuller data, there's no doubt that there's no Majorana."

https://doi.org/10.1038/d41586-021-00954-8

Authors retract Nature Majorana paper, apologize for "insufficient scientific rigour"

Leo Kouwenhoven, credit De Sebastiaan ter Burg

https://retractionwatch.com/2021/03/08/authors-retract-nature-majorana-paper-apologize-for-insufficient-scientific-rigour/

TU Delft

https://doi.org/10.5281/zenodo.6558216

Majorana – Why Open Data?

- Investigation by experts:
  - **Authors selected data** that supported the phenomenon they were looking for
  - **Authors omitted data** that could have raised questions about the conclusions
- "It is a good thing that **independent experts have looked at this as part of the integrity investigation**," says Tim van der Hagen, Rector Magnificus of TU Delft. "Science always involves **looking critically at results**, questioning and challenging them."

Source

TU Delft

https://doi.org/10.5281/zenodo.6558216

Make your data FAIR

In **line with the FAIR principles** … allows for the verification, reproducibility and digital preservation of findings; fundamental to high quality research outputs and research integrity.

Findable

Descriptive metadata and persistent identifier

Accessible

Data could be openly available OR authentication and authorisation procedures are necessary

Interoperable

Data needs to be integrated with other data and interoperate with applications or workflows.

Reusable

Documentation and license

Ethics in Research

- Create a Data Management Plan (DMP)
- Create Data
- Make your Data FAIR

- Store & Secure your Data
- Create Metadata
- Gain Informed Consent

- Share your Research Data
- Preserve your Research Data
- Licence your Data

https://libguides.ucd.ie/data/intro

Ethical Principles: During The Research Process

- **Ethical issues of using group-based methods:**
  - Participants should be **recruited ethically** by providing them with the appropriate information about your research so that they can make an informed decision.
  - Researchers need to be aware of the risks associated with research methods that allow for unpredictable interaction between participants or when potentially sensitive topics are being investigated.
  - There is a **risk of limited confidentiality** when participants participate in the research process as they might accidently repeat sensitive information they learn about other participants to those not involved in the project.
  - There is also a risk that **participants may overshare or contribute sensitive information during the data collection process** that may put them in danger of being ridiculed by their peers later on.

Information & Consent

To recruit potential participants, you need to provide them with information about your project, in order for them to be able to give you their fully **informed consent**.

Informed consent comprises three major elements:

- **Information**-When providing information researchers must ensure that participants are given sufficient detail about the nature of the research and the procedures involved; the information should highlight the objectives of the study, and any potential risks and benefits.
- **Voluntariness**-Consent must be freely given and may be withdrawn at any time. Undue influence may take the form of inducement or authority over prospective participants.
- **Comprehension** -Voluntary participation implies that participants make an informed choice while informed consent assumes that the information given is accurate. Both principles are underpinned by the principle that participant understands what it is they are being asked to participate in.

Anonymizing Your Data

- Remove direct identifiers, e g personal information such as names and addresses
- Aggregate or reduce the precision of variables that might be identifiable, e g recode postcode or neighbourhood data to Dublin North, Dublin South Galway urban, Galway rural
- Generalise text variables to reduce identifiability
- Restrict continuous variables to reduce outliers
- Pay particular attention to anonymising relational data, for example, some anonymised variables may become identifiable when considered in combination, combining location with special educational needs
- Be aware of case studies where research results have been “de-anonymized” (see case study on Moodle Sweeney, Latanya (2000) *“Simple Demographics Often Identify People Uniquely”*

Anonymising Your Qualitative Data

- You do not need much of somebody's life history to work out who they are, if you know them, or if they are distinctive in some way
- A distinctive event or combination of descriptions in a qualitative account could make somebody recognisable
- Concerns about privacy protection can mean that qualitative data may need some editing to ensure their anonymity When the data editing is complete, researchers should take care this has not distorted their data or changes what the data is telling you, for example, deleting all possible identifiers from text or sound recordings is a simple but blunt tool that creates data that are confidential but may be unusable.
- Anonymisation of qualitative data **can be particularly complex**, and is not simply a matter of removing personal information such as names or addresses, or of using pseudonyms

Ethical Principles: After The Research Process - Data Storage And Security

- Whether you are collecting new data or accessing existing data, you need to consider:
- Your planning should take account of what you need to do with hard copies, such as, paper notes of interviews; computer files with anonymised data that are not identifiable; and computer files with personal or identifiable data.

Data Storage and Security

- Files -including computer files -that contain personal or identifiable data (such as names) come under the terms of the Data Protection Act.

If your research involves data that comes under the remit of the Data Protection Act -and most research does -then it is a good idea to check with the Data Protection Officer in your organisation, to see if there are any standard protocols you should be following.

Computer files including those that have been anonymised still need to be held securely and can only be shared according to the terms of your consent from participants. Thus -for example -you need to get prior consent from participants if you plan to archive data for use by other researchers.

These files need to be encrypted or password protected, and only accessed by agreed members of the team.

- Particular care needs to be taken if you are sharing files within the research team -e.g. on shared computer drives, or by email -or if you are transferring personal data beyond the research team (e.g. if a gatekeeper is giving you a list of contacts).

Thank you for your attention!
